

AI-Powered Design Audit Automation

How I replaced a fully manual compliance review process with an AI-powered audit pipeline using Claude + Figma MCP

27 criteria automated

44 CX criteria

Days → hours

Pushkar Pandey · UX Research Lead · Experience Strategy

Manual audits were **slow**, inconsistent, and didn't scale.

01 / The Problem

Time Cost

2–3 days per audit manually cross-checking 27 experience criteria and 44 CX standards across Figma files one by one.

No consistency

Results varied by reviewer. Two people auditing the same product could reach different conclusions on identical criteria.

No self-serve

Product teams queued for central DesignOps to schedule every audit. No way to check compliance before shipping.

The Old Process

1. Figma Design File

2. DesignOps schedules review

3. Manual Figma inspection / CX Check

4. Generate and Share report to teams

Two automated tools - One pipeline.

02 / what i built

Tool 01

CX Assessment Tool

Evaluates against 44 criteria across 15 CX standards. Generates an interactive HTML report with in-report approval workflows reviewers approve or flag inside the report itself.

15 standards

44 criteria

In-report approvals

Tool 02

Experience Principles Verifier

Evaluates any Jio product against 27 criteria across 10 experience principles using live Figma design data extracted via Figma MCP. No screenshots real structured data.

10 principles

27 criteria

~10 min per audit

Outcome

Self served audit enabled

Product teams run compliance checks without waiting on central DesignOps — anytime, before any release.

Build with

Claude AI · Figma MCP · Interactive HTML · Figma Plugin API

From Figma file to audit report in minutes

03 / Process

1

Figma file URL provided

Component data, tokens, layout pulled live via Figma MCP

2

Figma MCP extracts design context

Real structured data — no screenshots needed

3

Claude AI evaluates against criteria

27 XP or 44 CX criteria — every one checked with a rubric

4

Pass / Partial / Fail scored per criterion

Each criterion gets a verdict with clear reasoning

5

Interactive HTML report generated

Downloadable, shareable — no special tool to open

6

In-report approval workflow

Reviewers approve, flag, or mark criteria inside the report

What changed.

04 / before vs after

XP criteria automated

27

CX criteria automated

44

product teams enabled

32+

per audit turnaround

~10m

Before

Manual process

- 2–3 days per audit
- 71 total criteria checked manually
- Inconsistent varied by reviewer
- Teams queued for DesignOps
- Findings in Notion hard to act on
- Not scalable past a few audits/month

After

Automated pipeline

- Minutes per audit
- 27 or 44 criteria fully automated
- Same rubric consistent every time
- Teams self-serve anytime
- Interactive HTML report with approvals
- Scalable across 30+ product teams

What I learned building this.

05 / learnings

01

AI works best with structure

Claude's evaluation quality improved significantly when criteria were written as specific, testable questions not broad principles. Prompt engineering took as long as building the tool.

02

Figma MCP is powerful but selective

Live design context extraction works well for components, tokens, and layout. Nuanced experience calls still need a human reviewer the tool doesn't replace judgement.

03

Adoption is a design problem

Getting product teams to trust an automated verdict required as much change management as engineering. The technical part was the easier half.

Honest note

This tool handles ~70% of what a manual audit covers. The remaining 30% nuanced emotional and contextual judgement still requires a human reviewer.

Let's talk about how I can bring this to your team.
